GOOD EVENING, ASIFSHIHABUDEEN779

Your study path through Artificial Intelligence starts here.

Sixteen topics from foundations to ethics, an AI tutor that answers anything, and quizzes that hold you to it.

CURRICULUM

Sixteen topics, one subject

The full path through Artificial Intelligence — from search and logic to transformers, reinforcement learning and AI ethics. Open any topic to study it, quiz yourself, or build a deck of flashcards.

Search topics and concepts

All topics | Foundations | Search & Reasoning | Machine Learning | Deep Learning | Applied AI | Ethics & Society

01
Foundations of AI
What artificial intelligence is, where it came from, and the questions that still define it.
Foundations · Beginner
45 min

02
Search & Problem Solving
How AI systems explore possibilities, from puzzles and grids to route planning.
Search & Reasoning · Beginner
50 min

03
Knowledge Representation & Logic
Encoding what a machine knows so that it can reason about it.
Search & Reasoning · Intermediate
55 min

04
Probability & Bayesian Reasoning
Reasoning under uncertainty — the mathematics of how AI updates its beliefs.
Search & Reasoning · Intermediate
50 min

05
Machine Learning Fundamentals
Instead of programming the rules, let the model learn them from data.
Machine Learning · Beginner
55 min

06
Regression & Classification
The two workhorses of supervised learning, and how to tell whether they are any good.
Machine Learning · Intermediate
60 min

AI TUTOR

Ask anything about AI

Precise, example-driven answers on any Artificial Intelligence topic — and a question back to check you followed.

Clear chat

Consider how your email inbox filters out junk. Instead of a human programmer writing a list of every possible "spammy" word, an **ML algorithm** is fed thousands of emails labeled as "spam" or "not spam." The system identifies statistical patterns—such as the frequency of words like "win," "urgent," or "cash"—to build a **predictive model**. When a new email arrives, the model calculates the probability that it is spam based on the patterns it learned previously.

The Formal Detail

In formal terms, **Machine Learning** is a branch of Artificial Intelligence where an **algorithm** optimizes its performance on a specific task by minimizing an **error function** over a **dataset**.

- **Training Data:** The historical examples used to teach the model.
- **Features:** The specific attributes the model looks at (e.g., word count, sender address).
- **Model/Inference:** The mathematical structure that makes predictions on new, unseen data based on the relationships it discovered during training.

Why It Matters

Traditional programming relies on **explicit programming** (if-then statements). **Machine Learning** replaces these hard-coded rules with **probabilistic inference**, allowing the computer to handle complex, messy real-world data that humans find difficult to define with simple rules.

Quick Check: If you wanted to build an ML model to predict whether it will rain tomorrow, what would you choose as your "training data"?

Ask about neural networks, transformers, reinforcement learning...

QUIZZES

Test what actually stuck

Generate a quiz on any topic in the curriculum. Every attempt is graded, explained and stored so your progress page stays honest.

Question 1 / 5

Which component of an AI agent is responsible for selecting an action based on its percepts and internal state?

- (A) Sensors
- (B) Actuators
- (C) Agent Program
- (D) Environment
